

## **REFLECTION**

I feel that overall this mini project allowed me to learn about simple functions I can use to create PONG. I was quite surprised that the skeleton in making PONG was just the past 6?? weeks of whatever we have learnt compiled into one sketch.

Throughout the mini project, there were times when I felt like it was hard to search for help as I wouldn't know how to explain it on google/safari. I wouldn't know how to phrase my words right to get the type of function I wanted to add. Having to also do up math for most of the positions and sizes were also a challenge for me (i am not the best in maths). But I learnt that I could also start with 'width/2' and 'height/2' and with the power of guesstimation, I am able to position my elements where I somewhat want them to be.

Other than the technical side of this project, I felt kind of accomplished when I could slowly see each part slowly being filled. With each reset after completing a line was quite fun to see the action/function appear.

However, something that I noticed was that I take a little longer to understand a function that was taught in class. I felt like I would have to push myself to work on to be able to understand a lot quicker if I wanted to shorten the amount of time I spend understanding than actually writing the code.
